The answers provided help students verify their understanding and identify areas needing further clarification.

Common Types of Problems and Their Solutions in Chapter 2

1. Problems on Uniformly Accelerated Motion

Typical Problem Structure

A typical problem involves an object starting from rest or an initial velocity, undergoing constant acceleration, and asking for parameters such as final velocity, displacement, or time.

Sample Problem and Solution Approach

- Identify known quantities: initial velocity (u), acceleration (a), and time (t) or displacement (s).
- Use appropriate equations of motion:

- $v = u + at$
- $s = ut + \frac{1}{2}at^2$
- $v^2 = u^2 + 2as$

- Substitute known values to find the unknown parameter.
- Verify units and reasonableness of the answer.

2. Graphical Problems of Motion

Understanding Graphs

Problems often include position-time, velocity-time, or acceleration-time graphs. Analyzing these helps interpret motion characteristics such as acceleration and velocity changes.

Solution Strategy

- Identify the relevant graph and what it represents.
- Determine slopes and areas:

- Slope of position-time graph = velocity
- Area under velocity-time graph = displacement

- Use geometric methods to calculate quantities from the graph.

3. Problems on Relative Velocity

Basic Concept

Relative velocity problems involve two objects moving in different directions, and the goal is to find how fast one object appears to move from the perspective of the other.

Solution Approach

- Define velocities of each object relative to a common frame.
- Apply the relative velocity formula:

- $v_{AB} = v_A - v_B$

- Consider directions: positive or negative based on chosen reference axes.
- Calculate the relative velocity accordingly.

4. Problems on Free Fall and Projectile Motion

Key Points

These problems often involve vertical motion under gravity, with or without initial velocity, and sometimes include horizontal components for projectile motion.

Solution Strategy

- Break motion into vertical and horizontal components.
- Use kinematic equations separately for each component:

- Vertical: $s = ut + \frac{1}{2}gt^2$
- Horizontal: $s = ut$ (constant velocity)

- Calculate time of flight, maximum height, or range based on problem requirements.
- Apply boundary conditions to find unknowns.

Deep Dive into Typical Problem Types and Solutions

Below, we'll explore common problem types found in Chapter 2 supplementary problems, along with detailed insights into their solutions.

1. Calculating Displacement and Velocity

Problem Type: Given initial velocity, acceleration, and time, find displacement or final velocity.

Solution Strategy:

- Use the equations of motion:
- $v = v_0 + a t$
- $s = v_0 t + \frac{1}{2} a t^2$
- Check units and signs (positive or negative acceleration).

Sample Solution Breakdown:

Suppose a problem states: An object starts from rest with an acceleration of $2\, m/s^2$. Find the displacement after 5 seconds.

- Initial velocity: $v_0 = 0$
- Final velocity: $v = 0 + 2 \times 5 = 10\, m/s$
- Displacement:

$$
s = 0 \times 5 + \frac{1}{2} \times 2 \times 5^2 = 0 + 1 \times 25 = 25\, m
$$

\]

Answer: The object travels 25 meters in 5 seconds.

Tip: Always verify the physical plausibility of your answer.

2. Graphical Analysis of Motion

Problem Type: Interpreting velocity-time and displacement-time graphs.

Solution Strategy:

- Use the area under the velocity-time graph to find displacement.
- Use the slope of the displacement-time graph to find velocity.
- Identify constant acceleration from the slope of the velocity-time graph.

Example:

Given a velocity-time graph with a straight line decreasing from 10 m/s to 0 m/s over 4 seconds, find:

- The acceleration
- The total displacement during this interval

Solution:

- Acceleration:

\[

a = \frac{\Delta v}{\Delta t} = \frac{0 - 10}{4} = -2.5\, m/s^2

\]

- Displacement:

- Area under the graph:

$$
\text{Area} = \text{Area of trapezoid} = \frac{(v_i + v_f)}{2} \times t = \frac{(10 + 0)}{2} \times 4 = 5 \times 4 = 20\, m
$$

Answer: The object experiences an acceleration of $-2.5\, m/s^2$ and covers 20 meters during the 4 seconds.

Tip: Use graphical interpretations to double-check algebraic solutions.

3. Free Fall and Gravity-Related Problems

Problem Type: Calculating the time of fall, impact velocity, or displacement during free fall.

Solution Strategy:

- Use:

$$
s = v_0 t + \frac{1}{2} g t^2
$$

where v_0 is initial velocity (often zero in free fall).

- For impact velocity:

$$
v = v_0 + g t
$$

Sample Problem:

An object is dropped from a height of 45 meters. Ignoring air resistance, find:

- Time to reach the ground
- Impact velocity

Solution:

- Time:

$$
s = \frac{1}{2} g t^2 \Rightarrow t = \sqrt{\frac{2s}{g}} = \sqrt{\frac{2 \times 45}{9.8}} \approx \sqrt{\frac{90}{9.8}} \approx \sqrt{9.18} \approx 3.03\, s
$$

- Impact velocity:

$$
v = g t = 9.8 \times 3.03 \approx 29.7\, m/s
$$

Answer: The object takes approximately 3.03 seconds to hit the ground and impacts with a speed of about 29.7 m/s.

Tip: Remember to account for air resistance only if the problem specifies it.

4. Relative Motion and Reference Frames

Problem Type: Analyzing motion of objects in different frames.

Solution Strategy:

- Use relative velocity:

$$
v_{A/B} = v_A - v_B
$$

- Consider the problem from the appropriate frame.

Example:

A train moves at 30 m/s east. A person walks inside the train at 2 m/s east relative to the train. Find the person's velocity relative to the ground.

Solution:

$$
v_{person/ground} = v_{train} + v_{person/train} = 30 + 2 = 32\, m/s
$$

Answer: The person moves at 32 m/s east relative to the ground.

Tip: Always define your reference frames clearly.
